

6 Reasons to Switch to

SIP TRUNKING

With Sierra w/o Wires, Inc.

Session Initiation Protocol (SIP) facilitates Voice over IP (VoIP) communication sessions for telephone services and other real-time communication services, such as instant messaging and conferencing. SIP Trunking establishes a communication connection over the Internet between a customer location and an Internet Telephony Service Provider (ITSP).

1 Cost Effective

- Eliminates the need to purchase Basic Rate Interfaces, Primary Rate Interfaces, or local PSTN gateways
- No need for separate voice and data connections
- Turns all telephone calls into local calls, reducing long-distance charges

2 More Efficient

Dynamically allocate bandwidth between your voice and data, as needed.

3 Ease of Growth

Quickly increase your call capacity, over the internet and at increments of one, without the need to purchase additional hardware.

4 Simple

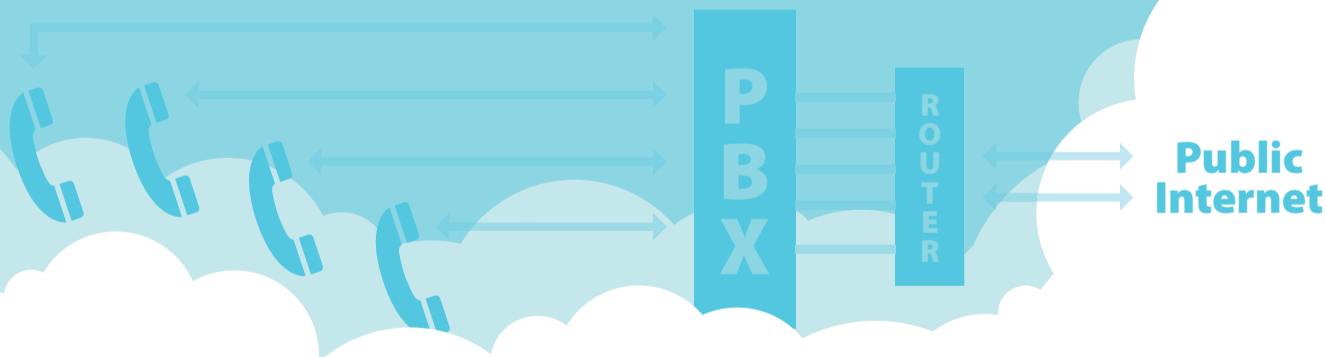

SIP Trunking creates a single network connection, allowing you to manage all communication with a single service provider.

5 Local Numbers

With SIP Trunking, you can eliminate the need for costly 1-800 numbers, and instead, establish presence in multiple cities by using local area codes.

6 Expert Support

The Sierra support team is available 24x7x365.

Trust the Experts.
Remote IT Solutions.

Improve your communication services.
